IS 664 – Standard Course Outline

COLLEGE OF BUSINESS ADMINISTRATION:

INFORMATION SYSTEMS DEPARTMENT

I. General Information

- Course number: IS 664
- Title: Modeling and Simulation
- Units: 3
- Prerequisites: IS 601: Quant. Methods for Managerial Decision Making and an average knowledge of Spreadsheet Environment.
- Course Coordinator: Khosrow Moshirvaziri
- SCO Prepared by: Khosrow Moshirvaziri, Faculty of CBA
- Date prepared/Revised: March 2013

II. Catalog Description

This course interleaves theory with hands-on lab sessions to explore technical skills necessary to understand and model computer based information systems. It provides an introduction to the techniques and modeling tools needed to construct and analyze performance models of computer telecommunication networks, business decision making, logistics, and supply chain systems.

III. Curriculum Justification

Analysts and manages find quantitative tools, such as spreadsheets, Monte Carlo, discrete event and continuous simulation environment, intuitive and user-friendly platforms for organizing information and performing “what if” analyses for making vital business decisions. This is a relatively a new area of applications, other than those of traditional engineering applications. These apparatus have therefore become indispensable tools of modern business and operational analysis. This course provides a comprehensive understanding of the wide range of analytical tools that can be used for modeling, analyzing, and ultimately designing best practices and processes in modeling and simulation. Particular emphasis is placed on discrete event simulation as it represents one of the most flexible and powerful technology available today.

Upon completion, the student will meet the following three specific CBA learning goals:

Learning Goal #1 – Critical Thinking (& Problem Solving Skills)
Learning Goal #2 – Ethics (Use and Interpretation of Data)
IV. Course Objectives and General Learning Goals

- Introduce what-if analysis through spreadsheet modeling, optimization and simulation, as it applies to the study and analysis of technological and quantitative systems for decision making. The introduction of simulation and spreadsheet models provide a framework to think about a wide range of issues that arise in the context of Homeland Security issues. Probabilistic simulation methods are a powerful tool for the study, analysis and design of such systems.

- To expose students to a wide range of applications for these methods and models, and to integrate this material with their introduction to national security management.

- To strengthen the student's analytic thinking and background in anticipation of the rest of the BA in Engineering Systems curriculum.

V. Student Learning Outcomes

A. Quantitative and Technical skills. Students will possess quantitative and technological skills enabling them to analyze, interpret business data, and to perform what-if analysis to improve operational performance.

B. Critical Thinking. Students will be able to demonstrate conceptual learning, critical thinking, and problem-solving.

C. Technology Selection. Students will be able to select proper technical approach and make use of appropriate technology for presenting an efficient solution.

D. Additional Tasks. Students will be proficient in the following tasks:

- Translate a verbal or graphical description of a decision problem into a valid decision model, by identifying variables, resources, and limitations.
- Organizing data and describing patterns and relations between variables verbally, numerically, graphically, and symbolically.
- Express a given decision model in a structured form for use with ExtendSim Simulation software and/or Risk Solver Platform.
- Determining whether enough data or information is given in resolving a problem situation.
- Making reasonable approximations of numerical results.
- Posing questions and making hypothesis about a given situation or a set of data or information.
- Recognize situations where quantitative analysis may provide useful in-sights and apply appropriate numerical and statistical techniques to reach conclusions.
• Evaluating and critiquing mathematical and statistical statements, arguments, and reasoning.
• Questioning assumptions, detecting fallacies, and evaluating risks associated with a decision.
• Assessing, comparing and selecting among multiple strategies for solving real-world problems and recognizing sources of error.

VI. Outline of Subject Matter
VII. Outline of Subject Matter

A. Topics on the practical skills necessary to design, implement, and analyze discrete-event simulation systems; and spreadsheet modeling.

B. Coverage of basic theory underlying what-if analysis and discrete-event simulation methodologies, in order to enable a critical understanding of simulation output in operational environments and build the foundations necessary to quickly adapt to future advances in simulation technology.

13  Assigned Projects – Workshop Session 1

14  Assigned Projects – Workshop Session 2

15  Final Project Presentations and Review (Exam 2)

VIII. Methods of Instruction

The course will be offered though formal lectures and series of hands-on demonstrations. Plenty opportunity will be provided for classroom discussion, group work, and student presentations. Students are expected to actively engage in participating their modeling and logical thinking skills through exercises and discussions.

Teaching Method

- Lectures and hands-on demonstrations
- Assignments
- Term Project (individual or team work)

IX. Extend and Nature of Technology Use

Students’ familiarity and moderate skills in spreadsheet manipulation (Microsoft Excel) will be assumed. Other modeling software packages and any additional Add-ins utilized will be covered. In addition to MS Excel, other software packages such as ExtendSim LT Version 8 or higher; Simulation and Modeling tools and Risk Solver Platform (RSP) or equivalent may be used.

X. Textbooks and Manuals

The following books are most popular modern textbooks used for teaching modeling, simulation, and spreadsheet approaches. The instructor may select materials from combination of the list below along with practical cases and application areas dealing with issues of interests in Technology, Telecommunications, Security and Recovery, and Logistics and Supply Chain.

XI. Instructional Policies Requirements

Grading and Plagiarism, withdrawal, absences, and others: University policy will apply. Grading will be based on performance on exams, assignments, projects, and class participation.
- Test 1 (20%)
- Test 2 (20%)
- Computer Assignments: (Assign: 6 or more bi-weekly) (6% each)
- Group Projects (20%)
- Active Participation (4%)

Students with Disabilities

Students with disabilities are responsible for notifying their instructor as early as possible of their needs for an accommodation of a verified disability. A student with a disability is urged to consult with Disabled Student Services as soon as possible in order to identify possible accommodations to enhance academic success.
