The Mission

The problem we will be trying to solve for the semester was originally taken from a puzzle book. Here is the problem as defined by the puzzle book.

"In the forest, you will find beehives and more importantly honeycombs. Along the path are bees. The number of bees at any given location is indicated by a number. There are a few ways your bear can travel to the forest. Your aim is to teach your bear how to make his way to the forest while encountering as few bees as possible"

Take a few minutes and see if you can solve the puzzle.
