Tuesday October 11, 2016

## Outline

(1) First Order Differential Equations
(2) Integrating Factor Method
(3) Superposition Principle

## Types of Differential equations

## Definition

A first order linear D.E. is of the form

$$
y^{\prime}+Q(x) y=R(x)
$$

where $Q(x)$ and $R(x)$ are functions of $x$.

## Types of Differential equations

## Definition

A first order linear D.E. is of the form

$$
y^{\prime}+Q(x) y=R(x)
$$

where $Q(x)$ and $R(x)$ are functions of $x$.

## Definition

A second order linear D.E. is of the form

$$
y^{\prime \prime}+P(x) y^{\prime}+Q(x) y=R(x)
$$

where $P(x), Q(x)$ and $R(x)$ are functions of $x$.

## Types of Differential equations

## Definition

A first order linear D.E. is of the form

$$
y^{\prime}+Q(x) y=R(x)
$$

where $Q(x)$ and $R(x)$ are functions of $x$.

## Definition

A second order linear D.E. is of the form

$$
y^{\prime \prime}+P(x) y^{\prime}+Q(x) y=R(x)
$$

where $P(x), Q(x)$ and $R(x)$ are functions of $x$.
If $R(x)=0$ we call the D.E. homogeneous.

## Integrating Factor Method

Question 1: Given a D.E. $y^{\prime}+Q(x) y=R(x)$, if you could find a function $f(x)$ such that

$$
\frac{d(f(x) y)}{d x}=f(x)\left(y^{\prime}+Q(x) y\right)
$$

could you solve the D.E.?

## Integrating Factor Method

Question 1: Given a D.E. $y^{\prime}+Q(x) y=R(x)$, if you could find a function $f(x)$ such that

$$
\frac{d(f(x) y)}{d x}=f(x)\left(y^{\prime}+Q(x) y\right)
$$

could you solve the D.E.?
Answer: Yes!

## Integrating Factor Method

Question 1: Given a D.E. $y^{\prime}+Q(x) y=R(x)$, if you could find a function $f(x)$ such that

$$
\frac{d(f(x) y)}{d x}=f(x)\left(y^{\prime}+Q(x) y\right)
$$

could you solve the D.E.?
Answer: Yes!
Question 2: Given a D.E. $y^{\prime}+Q(x) y=R(x)$, can you find the formula for a function $f(x)$ such that

$$
\frac{d(f(x) y)}{d x}=f(x)\left(y^{\prime}+Q(x) y\right)
$$

## Integrating Factor Method

Question 1: Given a D.E. $y^{\prime}+Q(x) y=R(x)$, if you could find a function $f(x)$ such that

$$
\frac{d(f(x) y)}{d x}=f(x)\left(y^{\prime}+Q(x) y\right)
$$

could you solve the D.E.?
Answer: Yes!
Question 2: Given a D.E. $y^{\prime}+Q(x) y=R(x)$, can you find the formula for a function $f(x)$ such that

$$
\frac{d(f(x) y)}{d x}=f(x)\left(y^{\prime}+Q(x) y\right)
$$

Answer: Yes! $f(x)=e^{\int Q(x) d x}$

## Integrating Factor Method

To solve $y^{\prime}+Q(x) y=R(x)$,
(1) Multiply both sides by $f(x)=e^{\int Q(x) d x}$
(2) Recognize that the L.H.S. is $\frac{d(f(x) y)}{d x}$
(0) Integrate both sides and solve for $y$.

Exercise: Solve $y^{\prime}+2 y=2 e^{x}$.
Exercise: Solve $x y^{\prime}+y=\sqrt{x}$.

## Superposition Principle

## Theorem

Given a homogeneous linear differential equation with solutions $f(x)$ and $g(x)$ then $a \cdot f(x)+b \cdot g(x)$ is also a solution for any constants a and $b$.

Exercise: Demonstrate this theorem for the D.E.
$y^{\prime \prime}+P(x) y^{\prime}+Q(x) y=0$
